EXECUTIVE AI BRIEFING

From Governed Data to Permitted AI Use

How executives turn trusted information into authorized, controlled and accountable AI operations that create business value.

THE EXECUTIVE TAKEAWAY

A well-governed dataset does not automatically authorize each AI operation. Enforce permission at the point of use, and keep operational controls active.

DATA ASSURANCE

Is the information trustworthy and suitable for this use?

- Provenance and lineage
- Ownership and stewardship
- Classification and fit for purpose

PERMITTED USE

Is this AI operation authorized, for this purpose, by this user?

- Legitimate business purpose
- Identity and entitlements
- Least-privilege access and actions

PERMISSION TO OPERATE

The control gateway that connects trusted data, authorized use, reliable behavior and ongoing oversight.

AI BEHAVIOR

Does the system perform reliably and responsibly?

- Accuracy and quality testing
- Fairness and risk checks (when relevant)
- Source evidence and explainability

OPERATING ASSURANCE

Do we keep it under control in real operations?

- Ongoing monitoring and drift alerts
- Incident response and exceptions
- Human intervention and reauthorization after significant changes

CONTINUOUS MONITORING & REVIEW

THE BUSINESS DECISION

Based on evidence across the four assurances, make a clear, accountable decision for this specific AI use.

PROCEED	RESTRICT	HOLD	STOP
Authorized and ready to operate.	Proceed with specific limits (e.g., data, users, scope).	Defer until key gaps are resolved (e.g., data, controls, tests).	Do not proceed (risk, compliance or value not met).

JAIR RIBEIRO • AI LEADER

ENTERPRISE AI • DATA • GOVERNANCE • ADOPTION • BUSINESS VALUE

EXECUTIVE DECISION TEST

Can the team demonstrate a denied request, an owned exception and a safe intervention before permission is expanded?

Management framework, not a legal classification or universal control checklist.
